Syllabus of M.Sc. Previous (Physics)

MSCPL101: Classical Mechanics and Mathematical Methods in Physics

Unit-I

Holonomic and non-holonomic constraints, D'Alembert's principle, generalized coordinates. Lagrangian, Lagrange's equation and its applications, velocity dependent, potential in Lagrangian formulation, generalized momentum, Legendre transformation, Hamiltonian, Hamilton's Canonical equation, calculus of variation and its application to simple problems, Hamilton's variational principle.

Unit-II

Derivation of Lagrange's and Hamilton's canonical equations from Hamilton's variational principle, extension of Hamilton's principle to non-conservative and non-holonomic systems, method of Lagrange's multipliers, conservation principle and Noether's theorem, conservation of energy, linear momentum and angular momentum as a consequence of homogeneity of time and space and isotropy of space respectively

Unit-III

Canonical transformation, Integral invariants of Poincare, Lagrange's and Poisson brackets as canonical invariants, Equation of motion in Poisson bracket formulation, Infinitesimal canonical transformation and generators of symmetry, Liouville's theorem, Hamilton Jacobi equation and its applications. Action-angle, variables adiabatic invariance of action angle variables, Kepler problem in action angle variables, theory of small oscillations in Lagrangian formulation, normal coordinates and its application, orthogonal transformation, Eulerian angles, Euler theorem, eigen values of the inertia tensor, Euler equations, Force free motion of rigid body.

Unit-IV

Fourier transforms: Fourier integrals, Fourier's transform and inversion theorem, Falting theorem, application of integral transforms to pulse propagation, Discrete Fourier transform, Fast Fourier transform, Laplace transform, Laplace transform of derivatives and integrals, derivatives integrals of Laplace transform, Laplace transform of periodic function, inverse Laplace transform, convolution theorem, impulsive functions, application of Laplace transform in solving linear differential equation with constant coefficients and with variable coefficients, linear partial differential equations

Unit-V

Analytic functions, Cauchy-Riemann conditions, Harmonic function, elementary complex functions and their properties, mapping Z and Z complex integration, definite integrals, Cauchy Goursat's theorem Cauchy integral theorem, Indefinite integrals, Cauchy integral formula, Morera's theorem, Fundamental theorem of algebra, analytic continuation, branches of multi valued function Taylor's series, Laurent's series, Green functions in mathematical physics, Random walk problem, Binomial, Poisson & Normal distributions. Group theory $SU(2), O(3)$. integration and differentiation of power series, zeros of analytic functions, singular point, residues, Cauchy residue theorem, poles evaluation of improper integrals, Jordan's lemma, integration around a branch point, multi valued functions.

Book Suggested:

- Classical Mechanics: Goldstein
- Classical Mechanics: L.P. Landau & H. M. Lifshitz
- Classical Mechanics: A. Ray Chaudhary
- Complex Variables & Functions: Churchill, Brown, Varchy
- Applied Mathematics for Engineers and Physicist: Pipes & Harvill
- Mathematical Methods: Potter & Goldberg

University Campus: Alaniya, Kota 325 003, Rajasthan Ph: +91-80941-62999

City office: CP Tower (4th Floor), IPIA, Road No-1, Kota (Raj.) -324005 Ph: +91-744-3040045 Fax: +91-744-3040050

- Mathematical Methods for Physicist: George Arkfen
- Mathematical Physics: A. Ghatak (McMillan)

MSCPL102: Classical Electrodynamics

Unit-I

Electrostatics: Electric field, Gauss law, differential form of Gauss law, Curl of electric field and the scalar potential, surface distribution of charges and dipoles and discontinuities in the electric field and potential, Poisson and Laplace equations, Green's theorem, uniqueness of the solution with Dirichlet or Neumann boundary conditions, formal solution of the electrostatics boundary value problem with Green's function, Electrostatics potential energy and energy density, capacitance

Boundary Value Problems in Electrostatics: Method of images, point charge in the presence of a grounded conducting sphere, point charges in the presence of a charged insulated conducting sphere, point charges near a conducting sphere at a fixed potential, conducting sphere in an uniform electric field by method of images, Green function for the sphere, general solution for potential, conducting sphere with Hemispheres at different potential, orthogonal functions and its expansion

Unit-II

Multipoles, Electrostatics of Macroscopic Media Dielectrics: Multipole expansion, of potential multipole expansion of the energy of a charge distribution in an external field, elementary treatment of electrostatics with permeable media, boundary value problems with dielectrics, molecular polarizability and electric susceptibility, models for molecular polarizability, electrostatic energy in dielectric media.

Magnetostatics: Differential equation of Magnetostatics and Ampere's law, vector potential and magnetic induction for a circular current loop, magnetic field of a localized current distribution, magnetic moment, force and torque on and energy of a localized current distribution in an external magnetic field, macroscopic equations, boundary conditions on B & H, methods of solving boundary value problems in magnetostatics, uniformly magnetized sphere in an external field, permanent magnetic shielding, spherical shell of permeable material in an uniform field.

Unit-III

Time Varying Fields, Maxwell's Equations, Conservation Laws: Energy in a magnetic field vector and scalar potential, Gauge transformations, Lorentz Gauge, Coulomb Gauge, Green functions for the wave equation, derivation of the equations of macroscopic electromagnetism, Poynting's theorem and conservation of energy and momentum for a system of charged particles and E.M. fields, conservation laws for macroscopic media.

Plane Electromagnetic Waves and Wave Equation: Plane wave in a nonconducting medium, frequency dispersion characteristics of dielectrics,

Wave Guide: Rectangular wave guide, TE & TM Modes, methods of excitation wave guide, Circular wave guide, causes of attenuation in wave guide, Q of the wave guide. conductors and plasmas, waves in a conducting or dissipative medium, superposition of waves in one dimension, group velocity, Causality in the connection between D and E, Kramers-Kronig relation.

Unit-IV

Magneto Hydrodynamics and Plasma Physics: Introduction and definitions, MHD equations, magnetic diffusion, viscosity and pressure, pinch effect, instabilities in a pinched plasma column, magneto hydrodynamic waves, plasma oscillations, short wavelength limit on plasma oscillations and Debye shielding distance.

Covariant form of Electromagnetic Equations: Mathematical properties of the space time of special relativity, invariance of electric charge, covariance of electrodynamics, transformation of electromagnetic field.

Unit-V

University Campus: Alaniya, Kota 325 003, Rajasthan Ph: +91-80941-62999

City office: CP Tower (4th Floor), IPIA, Road No-1, Kota (Raj.) -324005 Ph: +91-744-3040045 Fax: +91-744-3040050

Radiation by Moving Charges: Lienard-Wiechart potentials for a point charge, total power radiated by an accelerated charge, Larmor's formula and its relativistic generalization, angular distribution of radiation emitted by an accelerated charge, radiation emitted by a charge in arbitrary extremely relativistic motion, distribution in frequency and angle of energy radiated by accelerated charges, Thomson scattering and radiation, scattering by quasi free charges.

Scattering and dispersion: Introductory considerations, radiative reaction force from conservation of energy, Abraham Lorentz evaluation of the self-force, difficulties with Abraham Lorentz model, integral-differential equation of motion including radiation damping, line breadth and level shift of an oscillator, scattering and absorption of radiation by a level shift of an oscillator, scattering and absorption of radiation by an oscillator, energy transfer to harmonically bound charge.

Book Suggested:

- Classical electrodynamics: J. D. Jackson
- Classical Electricity and Magnetism: Panofsky & Philips
- Introduction to Electrodynamics: Griffiths
- Classical theory of fields: Landau & Lifshitz
- Electrodynamics of continuous Media: Landau & Lifshitz

MSCPL103: Quantum Mechanics and Atomic & Molecular Physics

Unit-I

States Amplitudes and Operators: States of a quantum mechanical system, Bra and Ket Algebra, representation of quantum mechanical states, properties of quantum mechanical amplitude, operators and change of state of a complete set of basic states, product linear operators, language of quantum mechanics, postulates, essential definition and consequent relations.

Observable and Description of Quantum System: Process of measurement, expectation values, time dependent of a quantum mechanical amplitude, Observables with no classical analogue, Spin dependence of quantum mechanical amplitude on position, the wave function, superposition of amplitudes, Identical particles, creation and annihilation Hamiltonian Matrix and time evolution of quantum mechanical states:- Hermiticity of the Hamiltonian Matrix, Time independent perturbation of an arbitrary system, Simple matrix examples of time independent perturbation, Energy eigen states of two state system, Diagonalizing of energy matrix, Time independent perturbation of a two state system, Perturbative solution: weak field and strong field cases, General description of a two state system, Pauli matrices, Ammonia molecule as an example of two state system, asymmetric harmonic oscillator.

Unit-II

Transition Between Stationary States: Transition in two state system, Time dependent perturbation, the Golden rule, Phase space, Emission and absorption of radiation, Induced dipole transition and spontaneous emission of radiation, Energy width of a quasi-stationary state.

The Co-ordinate Representation: Compatible observable, quantum conditions and uncertainty relations, co-ordinate representation of operators: position, momentum and angular momentum, time dependence of expectation values, The Schrodinger equation, energy quantization, periodic potential as an example

Unit-III

Hydrogen Atom: Gross structure energy spectrum probability distribution of radial and angular ($l = 1, 2$), Wave functions (no derivation), Effect of spin, relativistic correction to energy levels and fine structure, magnetic dipole interaction and hyperfine structure, the Lamb shift (only a qualitative description).

Interaction with External Fields: Non degenerate first order stationary perturbation methods, Atom in a weak uniform external electric field and first and second order Stark effect, Calculation of the polarizability of the

University Campus: Alaniya, Kota 325 003, Rajasthan Ph: +91-80941-62999

City office: CP Tower (4th Floor), IPIA, Road No-1, Kota (Raj.) -324005 Ph: +91-744-3040045 Fax: +91-744-3040050

ground state of H-atom and of an isotropic harmonic oscillator, Degenerate stationary perturbation theory, Linear Stark effect for H-atom levels, Inclusion of spin orbit and weak magnetic field, Zeeman effect, Strong magnetic field and calculation of interaction energy

Unit-IV

Symmetries and Angular Momentum: Symmetry transformation and conservation laws, Invariance under space and time translations and space rotation; Conservation of momentum, energy and angular momentum. Angular momentum operators and their eigen values, Matrix representation of angular momentum operators and their eigen states, Coordinate representation of the orbital angular momentum operators and their eigen states (spherical harmonics), Composition of angular momentum. Clebsch-Gordon coefficient, Tensor operators and Wigner Echart theorem, Commutation relations J_+ , J_- and J with reduced spherical tensor operator, Matrix elements of vector operators, Time reversal invariance and vanishing of static electric dipole moment of stationary state.

Unit-V

Systems with Identical Particles: Indistinguishability and exchange symmetry, Many particles wave function and Pauli's exclusion principle, Spectroscopic terms for atoms, The Helium atom, Variational method and its use in the calculation of ground state and excited state energy, Helium atom, Hydrogen molecule, Heitler London methods for H₂ molecule, WKB method for one dimensional problem, Application to bound states (Bohr Sommerfeld quantization) and the barrier penetration (Alpha decay problems).

Spectroscopy (Quantitative): General feature of spectra of one and two electron system, Vibration band spectrum of a molecule, P.Q & R branches, Raman spectra for rotational and irrotational transitions, comparison with infrared spectra, General features of electronic spectra, Frank Condon principle.

Book Suggested:

- Quantum Mechanics-A Modern Approach: Ashok Das & A.C. Melissions
- Quantum Mechanics: P.A.M. Dirac
- Quantum Mechanics (2nd ed.): E. Merzbecker
- Quantum Mechanics- Non relativistic theory: L.P. Landau & H. M. Lifshitz
- Quantum Mechanics: Thankapann (New Age International pub.)
- Quantum Mechanics- Theory & Applications: A. Ghatak & S. Loknathan
- Atomic Spectra: White
- Molecular Spectra: Hertzberg
- Atomic and Molecular Physics: T.A. Littlefield
- Elementary Atomic Structure: G. R. Woodgate
- Quantum Physics Atoms, Molecules, Solid & Nuclear Particles: Eistenberge & Resnick.
- Quantum Mechanics, B H Branson and C. J. Joachain, Pearson Education.

MSCPL104: Electronics, Numerical Methods and Computer Programming

Unit-I

Linear Small Signal and Direct Coupled Amplifier-R.C. Coupled C.E. Amplifier and its response in different frequency ranges, effect of cascading expression of bandwidth in low and high frequency ranges, emitter follower, tuned amplifier (small signal) single and double tuned amplifiers, Differential amplifier, common mode rejection ratio, operational amplifier and its basic applications.

Wave Shaping Circuits: Exponential circuit response, differentiation and integration by R.C. and L.R circuits, clipping or limiting circuit, clamping circuit, general feature of a time base signal, thyatron sweep circuits, circuits to improve linearity, Miller and Boot strap sweep circuits.

Unit-II

University Campus: Alaniya, Kota 325 003, Rajasthan Ph: +91-80941-62999

City office: CP Tower (4th Floor), IPIA, Road No-1, Kota (Raj.) -324005 Ph: +91-744-3040045 Fax: +91-744-3040050

Logic and Integrating Circuits: Boolean algebra, binary counting, counting to a base other than two, binary counter, conversion of binary counter in a decade counter, Decoder, logic gates: NOT, OR, AND, NAND and their circuits, Micro electronic devices, basic principles of LED & solid state laser. basic concepts about fabrication and characteristics of integrated circuits

Multivibrators: Astable, monostable and bistable multivibrators, frequency of a stable vibrator, frequency control and synchronization, triggering of bistable, Blocking oscillator

Unit- III

Errors in Numerical Analysis: - Computer arithmetic, sources of errors, Round off errors, Errors analysis, Condition and stability, Approximation, functional and errors analysis, The method of Undetermined coefficients.

Interpolation: Interpolation, Finite differences, Gauss central difference formula, Newton's formula for interpolation, Lagrange's interpolation formula, Double interpolation, Numerical differentiation, Newton and Starling's formula, Solution of linear systems, Direct and iterative, Eigen value problems.

Unit-IV

Solution of Non-Linear Equation: Bisection method, Newton's Method, Modified Newton's method, Method of integration, Newton's method and method of integration for a system of equations, Newton's method for the case of complex roots, Integration of functions: Trapezoidal and Simpson's rules, Gaussian quadrature formula, singular integrals, Double integration.

Integration of Ordinary Differential Equation: Predictor Corrector method, Runga-Kutta methods, Simultaneous and higher order equations, Numerical integration and differentiation of Data, least squares approximation, computer simulation, Monte Carlo method, Curve fitting.

UNIT V

Visual Basic.Net. Net environment, Data Types, Operators, Variable, expressions, jumping, branching and looping statements, input/output statements, array, sub-routing commands for plotting a graph, statement for handling input /output files, programming of simple problems.

OR

C++ Programming

Introduction: Introducing Object-Oriented Approach, Basic programming of C++: data types, operators, input and output, Control Statements: Branching, Conditional and Looping Controls, Array, functions. Classes and **Objects:** Encapsulation, abstract data types, Object & classes, attributes, methods, C++ class declaration, State identity and behaviour of an object, Inline functions and inline member functions, Constructors and destructors, object types.

File Handling: Stream Classes Hierarchy, Opening and closing FILE, Read and write in file. File pointers and Manipulations. Error Handling in File Operation. Command line Argument, Templates in C++

Book Suggested:

- Electronics-fundamentals and Applications: Ryder
- Integrated Electronics: Millman & Halkias
- Pulse digital and switching Waveforms: Millman & Taub
- Network-Line and Fields: Ryder
- Electronics Devices and Circuits: Bapat

University Campus: Alaniya, Kota 325 003, Rajasthan Ph: +91-80941-62999

City office: CP Tower (4th Floor), IPIA, Road No-1, Kota (Raj.) -324005 Ph: +91-744-3040045 Fax: +91-744-3040050

- Programming in Basic: B. Balguruswamy (McGraw Hill-1985)
- Introductory Methods of Numerical Analysis: S.S. Sastry
- A first course in Numerical Analysis: A. Ralston & P. Rabinowitz (McGraw Hill-1985)

Physics Practical

- Use of Michelson's 'Interferometer to determine:
 - Wave length of monochromatic light.
 - D1 for sodium doublet.
 - Thickness of the given mica sheet.
- Use Fabry parot's interferometer to determine:
 - Wave length of sodium light.
 - D1 for sodium doublet.
- Verify Fresnel's Laws.
- Determine the wavelength of Neon light taking Hg source as a standard source applying Hartman's formula.
- Use Bebinat's compensator,
 - To analyze elliptically polarized light.
 - To determine the phase difference introduced between ordinary & extraordinary rays.
- Determine Stefan's constant.
- Design a Double stage R.C. Couped amplifier and study:
 - Frequency response.
 - The amplitude characteristics.
- Determine the capacitance, resistance and inductance of a coil at radio frequency and to study the variations of Z with frequency
- Determine the, gm & rp of a triode by bridge method and study the variation of these quantities with grid voltage
- Study the series and parallel response circuit:
 - (i)To plot the frequency response curve characteristics of series circuit.
 - (ii)To plot the frequency response of parallel tuned circuit.
- To design and study the frequency response of a cathode power.
- To study the waveform characteristics of a stable multivibrator.
- To design C.R.O. and determine its frequency by varying C&R.
- To design and calibrate a Hartley Oscillator.
- To study frequency response of phase characteristics of:
 - Low pass filter.
 - High pass filter.
- To design & study the Dynatron oscillator.
- Any other experiment of equivalent standard can be added.

MSCPL201: Advanced Quantum Mechanics & Quantum field Theory

Unit-I

Scattering (Non-relativistic)-: Differential and total scattering cross section, solution of scattering problem by the method of partial wave analysis, expansion of a plane wave into a spherical wave and scattering amplitude, optical theorem applications: scattering from the delta potential, square well potential and hard sphere, scattering of identical particles, energy dependence and resonance scattering, Breit Wigner formula, quasi stationary state, Lippman Schwinger equation and the Green's function approach for scattering problem, Born approximation and its validity for scattering problem, Coulomb scattering problem under first Born approximation in elastic scattering.

University Campus: Alaniya, Kota 325 003, Rajasthan Ph: +91-80941-62999

City office: CP Tower (4th Floor), IPIA, Road No-1, Kota (Raj.) -324005 Ph: +91-744-3040045 Fax: +91-744-3040050

Unit-II

Relativistic Formulation and Dirac equation: Attempt for relativistic formulation of quantum theory, Klein-Gordon equation, probability density and probability current density, solution of free particle K.G. equation in momentum representation, interpretation of negative probability energy solutions, Dirac equation for a free particle, properties of Dirac matrices and algebra of gamma matrices, non-relativistic correspondence of the Pauli equation (inclusive of electromagnetic interaction), Solution of the free particle, Dirac equations, orthogonality & completeness relation for Dirac spinors, interpretation of negative energy solutions & hole theory

Unit-III

Symmetries of Dirac Equation: Lorentz boost, Lorentz covariance of Dirac equation, Proof of covariance & derivation of Lorentz transformation matrix and rotation matrices for Dirac spinors, projection operators involving four momentum & spin, parity (P), charge conjugation (C), time reversal and CPT operators for Dirac spinors, bilinear covariant and their transformation behavior under Lorentz transformation, P, C, T & CPT, expectation values of coordinate & velocity involving only positive energy solutions, Zitter Bewegung, Klein paradox.

Unit-IV

Photon as a quantum mechanical excitations of radiation field, fluctuations and the uncertainty relation, validity of classical description, matrix element for emission and absorption, spontaneous emission in the dipole approximation, Rayleigh scattering, Thomson scattering & Raman effect, Radiation damping & resonance fluorescence.

Unit-V

Quantum Field Theory: Scalar and vector fields, Classical Lagrangian field theory, Euler Lagrange's equation, Lagrangian density for electromagnetic field, occupation number representation for simple harmonic oscillator, linear array of coupled oscillators, second quantization of systems of identical bosons, second quantization of real Klein-Gordon field and complex Klein-Gordon field, meson propagator, second quantization of systems of identical bosons.

Occupation number representation for Fermions, second quantization of the Dirac field, Fermion propagator the e. m interaction & gauge invariance, covariant quantization of the free electromagnetic field, photon propagator.

S-Matrix: S-matrix expansion, Wick's theorem, diagrammatic representation in configuration

space, momentum representation, Feynman rules of QED, Feynman diagrams of basic processes, Application of s-matrix formalism, Coulomb scattering, Bhabha scattering, Moller scattering, Compton scattering and Pair production

Book Suggested:

- Quantum mechanics, A modern approach-Ashok Das & A.C. Melissions (Gordon & Breach Science Publishers).
- Quantum Mechanics (second edition)-E. Merzbeker (John Wiley)
- Relativistic Quantum Mechanics -Bjorken & Drell (Mc Graw hill)
- Advanced Quantum Mechanics -J.J. Sakurai (John Wiley & Sons)
- Quantum mechanics-Thankpapn V.K. (Wiley Eastern ltd. New Delhi)
- Quantum field Theory-F. Mandal & G Shaw (John Wiley)
- Elements of Advanced Quantum Theory- J.M. Ziman (Cambridge)

University Campus: Alaniya, Kota 325 003, Rajasthan Ph: +91-80941-62999

City office: CP Tower (4th Floor), IPIA, Road No-1, Kota (Raj.) -324005 Ph: +91-744-3040045 Fax: +91-744-3040050

MSCPL202: Nuclear Physics

Unit-I

Two Nucleon System and Nuclear Forces: General nature of the force between nucleons, saturation of nuclear force, charge independence & spin dependence, general forms of two nucleon interaction, central, non-central & velocity dependent potential, analysis of the ground state (3S₁) of deuteron using a square well potential, range depth relationship, excited states of deuteron, discussion of the ground state of deuteron under non central forces.

Unit-II

Nucleon-Nucleon Scattering & Potentials: Partial wave analysis of two neutron-proton scattering at low energy assuming a central potential with square well shape, concept of the scattering length, Coherent scattering of neutrons by protons in (ortho & para) hydrogen molecule, conclusion of these analysis regarding scattering lengths, range & depth of the potential, effective range theory (in neutron-proton scattering) and shape independence of nuclear potential, A qualitative discussion of proton-proton scattering at high energy, hard core potentials and Red hard core and soft core potentials, main features of the One Boson Exchange Potential (OBEP) (no derivation).

Unit-III

Nuclear shell Model: Single particle & collective motions in nuclei, assumption & justification of the shell model, average shell potential, spin orbit coupling, single particle wave functions and level sequence, magic numbers, shell model predictions for ground state parity, angular momentum and their comparison with experimental data, configuration mixing, single particle transition probability according to the shell model, selection rules, approximate estimates for transition probability and Weisskopf units, nuclear isomerism.

Collective nuclear models: Collective variables to describe the collective models of nuclear motion, Parameterization of nuclear surface, A brief description of the collective model Hamiltonian (in the quadratic approximation), vibrational modes of spherical nuclei, collective modes of deformed even-even nucleus and moments of inertia, collective spectra and electromagnetic transitions in even nuclei and comparison with experimental data, Nilsson model for the single particle states in deformed nuclei.

Unit-IV

Nuclear Gamma & Beta Decay: Electric & Magnetic multipole moments and gamma decay probabilities in nuclear system (no derivation), reduced transition probability, selection rules: internal conversion & zero-zero transition.

General characteristics of weak interactions, Nuclear beta and lepton capture, electron energy spectrum and Fermi-Kurie plot. Fermi theory of beta decay (parity conserved selection rules Fermi and Gamow Teller) for allowed transition: ft values, general interaction Hamiltonian for beta decay with parity conserving and non-conserving terms, forbidden transition, experimental verification of parity violation.

Nuclear Reactions: Theories of nuclear reactions, partial wave analysis of reaction cross section: compound nucleus formations & break-up, resonance, scattering & reaction, Breit Wigner dispersion formula for S-Wave ($l=0$), continuum cross section: statistical theory of nuclear reactions, evaporation probability and cross section for specific reactions, electric quadruple & magnetic dipole moments, state mixture.

The optical model, stripping and pickup reactions and their simple theoretical description (Butler Theory) using plane wave Born approximation (PWBA), short comings of PWBA, nuclear structure studies with deuteron proton stripping (d,p) reaction.

Unit-V

Interaction of Neutrons, EM Radiation and Charged Particles with Matter: Law of absorption and attenuation coefficients, slowing down & law for neutron capture photoelectric effect, Compton

University Campus: Alaniya, Kota 325 003, Rajasthan Ph: +91-80941-62999

City office: CP Tower (4th Floor), IPIA, Road No-1, Kota (Raj.) -324005 Ph: +91-744-3040045 Fax: +91-744-3040050

Scattering, pair production, Klein Nishima cross section for polarized & unpolarized radiation, angular distribution of scattered photon & electrons, energy loss of charged particles due to ionization, Bremsstrahlung energy, target and projectile dependence of all three processes range energy curves straggling.

Experimental techniques: Gas filled counters, BF counter, scintillation counters, solid state detectors, surface barrier detectors, neutron activation detector, electronic circuits used with typical nuclear detector properties, chambers Nuclear emulsions techniques of measurement and analysis of tracks, proton synchrotron, electron accelerator and neutron generators, acceleration of heavy ions

Book Suggested:

- Theoretical Nuclear Physics: J.M. Blatt & V.E. Weisskopf.
- Introductory Nuclear theory: -L.R.B. Elton, ELBS Publ. London 1959.
- Nuclear physics: - B.K. Agarwal, Lok Bharti Prakashn. Allahabad 1989.
- Nuclear Structure: -M. K. Pal, Affiliated East West Press, 1982.
- Nuclear physics: - R.R. Roy & B.P. Nigam. Willy Basten, 1979
- 6. Structure of the Nucleus: - M.A. Preston & R.K. Bhaervi, Addison Wesley.
- Introductory Experimental Nuclear Physics: - R.M. Singru Wiley Eastern pvt. Ltd.
- Nuclear Physics: - Techniques of Nuclear Structure (vol. I) England.
- The Atomic Nucleus: - R.D. Evans Mc Graw Hill, 1955.
- Introduction to Nuclear Physics: H. Enge. Addison Wesley, 1970.
- Elements of Nuclear Physics: - W.E. Burcham, ELBS Longman, 1988.
- Concepts of Nuclear Physics: - B.L. Cohen, Tata Mc Graw Hill, 1988.
- Nuclei & Particles -E. Segre, Benjamin 1972.
- Nuclear Physics: - I. Kaplan, Addison Wesley 1963
- Introductory Nuclear Physics: -D. Halliday Wiley 1955
- Introduction of Nuclear Physics & Chemistry: Harvey.
- The Physics of Nuclear Reactions: W.M. Gibson, Pergamum Press.
- Nuclear Interaction: - S. De Benedetti, Wiley 1955.

MSCPL203: Solid state Physics

Unit-I

Lattice Vibrations and Thermal Properties: Lattice specific heat, theoretical estimates of Einstein and Debye temperatures, Wave mechanics of phonons, Creation and annihilation operators, Elastic waves and lattice vibration in one dimensional crystal, Long range forces and the reciprocal lattice method, Lattice vibration of a diatomic linear chain, Dispersion relation for three dimensional crystals, Born-Von Karman boundary conditions and density of states, Experimental observation of phonon frequencies, equation of state of the crystal lattice, Thermal Conductivity of insulators.

Unit-II

Theory of Metals: Fermi Dirac Distribution Function, density of states, temperature dependence of Fermi energy, Specific heat, Boltzmann equation and mean free path, relaxation time and scattering processes, thermal conductivity and electrical conductivity (using FD statistics). Wiedemann- Franz ratio, susceptibility, Drude's theory of light absorption in metals, Hall effect.

Band theory of metals: Bloch theorem, Kronigpenney model, Effective mass of electrons. Wigner-seitz approximation, nearly free electron model, tight binding method and calculation of density of states for S-band in simple cubic lattice, Cyclotron Resonance and Hall effect, de-Hass van Alphen effect, Experimental methods in determination of band structure, Limitations of band theory

University Campus: Alaniya, Kota 325 003, Rajasthan Ph: +91-80941-62999

City office: CP Tower (4th Floor), IPIA, Road No-1, Kota (Raj.) -324005 Ph: +91-744-3040045 Fax: +91-744-3040050

Unit-III

Semiconductors: Law of mass action, calculation of impurity conductivity, ellipsoidal energy surfaces in Si and Ge, Hall effect recombination mechanism, Optical transitions and Shockley Read theory, excitons, photoconductivity, photo luminescence.

Nano-Science and Nano-Technology: Introduction to nano-science, nano-technology and nano-materials, evolution of nano-technology from micro-technology

Imperfection in solids: Point, line planer and defects, colour centers, F-Centre and aggregate centers in alkali halides, John Teller effect, Single crystal growth, crystal whiskers.

Unit-IV

Magnetism: Larmor diamagnetism, paramagnetism, Curie Langevin classical theory, Quantum theory of paramagnetism, susceptibility of rare and transition metals, Ferromagnetism: Weiss theory Quantum theory of Ferromagnetism, origin of domains, Bloch Walls, Anti ferromagnetism, Ferrites, Magnons, magnetic resonance, Nuclear magnetic resonance, magnetic materials.

Superconductivity: Electromagnetic Properties, Thermal properties, isotope effect and electron phonon interaction, microscopic theory of superconductivity, Mc Millan's formula (no derivation), High temperature superconductivity in cuprates, fullerenes (basic ideas), Organic super conductors (basic ideas), Superconducting tunneling, application of super conductivity

Unit-V

Quantum Statistics and Elementary Excitations of Electron Gas: Simple harmonic oscillator, Annihilation and creation Operators, coupled oscillators, linear chain, Bosons, Fermions, second Quantization, Hamiltonian for two particles, Fermions Boson Interaction, Landau theory of Fermi liquids.

Group theory: Group. Group Multiplications table, Representation of group (i) Representation of the triangle group (ii) Representation of the space group of a crystal. (iii) Normal modes of vibration of O₃ molecule.

Book Suggested:

- Intermediate Quantum theory of solids- A.D. E .Animalu, (Prentice Hall).
- Solid state Physics-Kittel, (John Wiley 7th ed.).
- Quantum theory of Solids- Kittel, (John Wiley).
- Solid State Physics Source books- S.P. Parker, (Mc. Graw Hill).
- Solid State Physics- Harrison, (Benjamin Press).
- Quantum Solid State Physics-S.V.Vonsovsky & M.I. katsnelson, (Springer Verlag)
- High.T. Superconductivity- Sinha, (Nova Science, New York USA)
- Superconductivity-key Problem-Kaklioi, (Arihant).
- Nano-Science & Nano Technology-Retner-Retner.

MSCPL205: High Energy Physics

University Campus: Alaniya, Kota 325 003, Rajasthan Ph: +91-80941-62999

City office: CP Tower (4th Floor), IPIA, Road No-1, Kota (Raj.) -324005 Ph: +91-744-3040045 Fax: +91-744-3040050

Unit-I

Discovery of Muon, mesons, pions, nucleon interaction and isospin analysis, Discovery of resonances and stranger particles, Gell-Mann Nishima Scheme, K-decays, strangeness oscillation and K_0 regeneration phenomenon, Discovery of j/p Si Particles, charm and bottom flavours.

Qualitative ideas of interactions, QED, QCD weak interaction, Addition conservation laws, Charge, colour, Baryon number, lepton number, flavour etc. and particle decays.

Unit-II

Invariance and operators in Quantum mechanics, Translations and rotations, Parity, tests of Parity conservation, charge conjugation invariance, eigen state of charge conjugation operators, Positronium decay, Experimental test of E invariance, Time reversal invariance, Tests of CPT invariance, SU (2) of isospin, Isospin of two nuclear system, isospin for antiparticles C-parity, SU (3) (colour and flavour), quark-antiquark states, mesons, 3 quark states, Baryons magnetic moment, Heavy quark: charm and beyond, Hardon masses colour factors.

Unit-III

Non-relativistic time dependent perturbation theory, Rules for scattering amplitudes in Feynmann-Struckelberg approach cross section in terms of invariant amplitude M variables, Decay Rates in terms of M invariants, An electron interacting in field, calculating, cross section for $e + e - e + e -$ Moller scattering and e.m. scattering and process $e + e - e + e -$. Helicity conservation of high energies in lab frame, Kinematic relevant to the parton model.

Unit-IV

Photons and their polarization vectors propagators of (I) Spinless particles (II) electron (III) photon, The prescription for propagators, summary of Feynmann rules for QED, producing a charge distribution with electrons, form factors, e-p scattering ep-ex formalism for analyzing as (Virtual) photon-proton, total cross section and Bjorken scaling, Quarks with in the proton gluons.

Unit-V

Classification of weak interactions: Nuclear Decay, Fermi theory, Inter-partition of coupling, G-parity violating and V-A form of weak current Cobalt-60 experiment, Parity violation in Beta decay, Experimental determination of neutrino helicity, Lepton helicities in pion and muon decay, weak decays of strange particles: Cabibbo theory, Quantitative ideas about discovery of W_{\pm} and Z_0 .

Book Suggested:

- Introduction to High Energy Physics_ D.H. Perkins.
- Quarks and leptons- Halzin and Martin.

Physics Practical

- Determine fine structure constant using sodium doublet
- Verify Cauchy's relation & determination of constants.
- To determine e/m for an electron by Zeeman effect.
- Study the characteristics curve of klystron.
- Find out the percentage resolution of given scintillation spectrometer using Cs-137.
- Find out the energy of a given X-ray source with the help of a scintillation spectrometer.

University Campus: Alaniya, Kota 325 003, Rajasthan Ph: +91-80941-62999

City office: CP Tower (4th Floor), IPIA, Road No-1, Kota (Raj.) -324005 Ph: +91-744-3040045 Fax: +91-744-3040050

- Plot the Gaussian distribution curve for a radioactive source. 11. To study the frequency and phase characteristics of band phase filter.
- Study the wave from characteristics of transistorized a stable symmetrical multivibrator using CRO & determines its frequency by various C & R.
- Artificial transmission line.
- To determine the unknown impedance using slotted line section smith chart in the K-band.
- To determine the e/m of an electron by magnetron valve method.
- To determine the velocity of waves in water using ultrasonic interferometer.
- Determination of Land's 'g' factor for IRRH crystal using electron spin Resonance spectrometer. \
- To determine e/k using transistor characteristics.
- To study dark and illumination characteristics of p-n junction solar cell and to determine (i) its internal series resistance (ii) Diode ideality factor.
- To study the characteristics of following semiconductor devices (i) VDR (ii) Photo transistor (iii) Thermistor (iv) IED
- To study the characteristics of MOSTET and MOSFET amplifier.
- To study dark and illumination characteristics of p-n junction solar cell and to determine its. (i) maximum power available (ii) Fill factor.
- Any other experiments of the equivalent standard can be set
